

Safe-Zone System

(for use by regulatory agencies of the government)

Safe-Zone is a unique software tool that conducts technical classification of dual-use and munitions items. It employs an active machine learning system to conduct both Product Screening (end use) as well as Customer Screening (end user).

Easy to Use

The system generates some targeted questions about commodity description (final product, component or technology), and then uses its powerful search engine to provide an answer, within minutes, of the precise licensing requirement for that item. If required, it also screens all parties to a transaction.

What are the Answers Based on?

- Safe Zone's ML tool searches through a large dictionary that houses control lists of multilateral regimes (NSG, MTCR, WA and AG), regional list (EU-Dual Use and Munitions), and US-EAR & ITAR to identify the precise licensing requirement of the item under review.
- It also extracts data from technical drawings, brochures and from the manufacturer's website to check the parameters of the product, as also of brokers & intermediate consignees if/as required.
- It then draws upon Safe Zone's proprietary Dictionary to produce a highlighted list of dangerous or suspicious words or phrases that it found suggesting possible WMD or military use of the item.
- Its extensive customer screening data bank includes various categories of entities, drawing upon the BIS Consolidated List, OFAC lists, UN lists of sanctioned entities, and more.

Customization Capabilities

- Safe Zone has multi-lingual capability
- It can be configured or customized for use by any user (e.g., user's control list and entities lists can be added).
- It can be built inside the firewall of the user as a stand-alone system.

Who Finds it Useful?

With different parameter controls, Safe Zone modules are being used by:

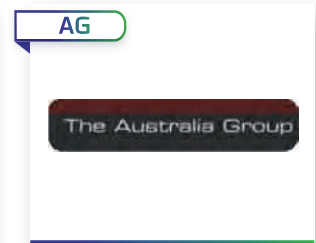

- licensing agencies
- customs authorities
- manufacturing companies

About the Company

The R&D Center of Safe Zone is located on Mount Carmel in Haifa (Israel).

It has an established subsidiary office in India and is in the process of registering an office near Washington, DC.

The core of the company is a group of engineers with decades of operational experience in various niche areas, whose sector-specific expertise is complimented by those of professional software developers in order to design, build, test and operate a set of innovative tools.
